
ABSTRACT

62
Telescopic leg ladder that may be used on an uneven surface. The legs of the ladder have a telescopic device that may be threaded, that allows the individual legs of the ladder to be extended and fixed by a securing device. This securing device makes it possible to extend either leg of the ladder on uneven surfaces and will make the use of the ladder safer, quicker and easier on uneven surfaces. The ladder has adapted feet to provide for loss coefficient of friction. Pads on the upper area of the ladder also prevent slippage and damage to surfaces where the ladder is leaning.
